Advanced WAN Ethernet Services

May 01, 2013

Version 1.0

3

Advanced WAN Ethernet Services

- Advanced WAN Service Layers
- Optical Interconnections
 - CWDM
 - DWDM
- Carrier Ethernet Architecture
 - E-Line Service
 - E-LAN Service
 - E-Access Service

Advanced WAN Ethernet Services

➤ Advanced WAN Service Layers

➤ Optical Interconnections

- CWDM
- DWDM

➤ Carrier Ethernet Architecture

- E-Line Service
- E-LAN Service
- E-Access Service

Advanced WAN Service Layer

➤ Service Providers

- Like to provide “Next-Gen” WAN services
- Low impact on existing FIBER infrastructure
- Managed services built on Ethernet allow the service provider to deliver advanced WAN functions to customers that are using Ethernet

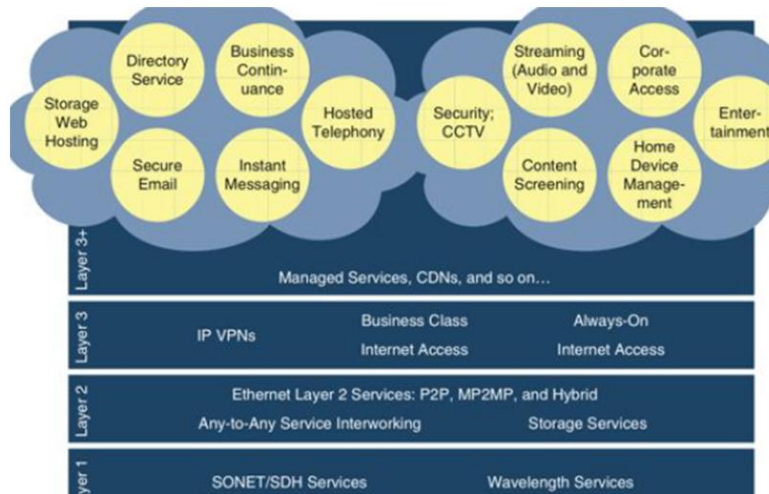

May 01, 2013

Version 1.0

6

- Service providers are interested in providing advanced WAN services that can be supported with low impact on their existing fiber infrastructure.
- Managed services such as storage, content switching, web hosting, instant messaging, and security built on Ethernet allow the service provider to deliver advanced WAN functions to customers that are using Ethernet

WAN Services Layers And Customer Applications

May 01, 2013

Version 1.0

7

Figure illustrates the relationship between the different WAN services layers and customer applications.

WAN Services Layers And Customer Applications

➤ Customers

- Familiar equipment
- Higher bandwidth with traditional WAN links
- Lower bits-per-second costs

May 01, 2013

Version 1.0

8

Customers have multiple reasons for requesting advanced WAN services based on Ethernet:

- Familiar equipment is used. Customers can utilize their existing devices.
- Higher bandwidth is possible than with traditional WAN links. 5Mbps service on FastEthernet.
- Lower bits-per-second costs can be supported.

WDM Overview

➤ WDM - Wavelength Division Multiplexing

- Multiplexer at the Transmitter
- De-multiplexer at the Receiver

➤ Media Convertor

- Electrical to Optical format
- Optical to Electrical format

➤ CWDM - Coarse Wavelength Division Multiplexing

➤ DWDM - Dense Wavelength Division Multiplexing

May 01, 2013

Version 1.0

10

A wavelength-division multiplexing (WDM) system uses a multiplexer (mux) at the transmitter to place multiple optical signals on a fiber and a demultiplexer (demux) at the receiver to split them off of the fiber. The signals use different wavelengths.

Media Convertors: Before being multiplexed, source signals might be converted from electrical to optical format, or from optical format to electrical format and back to optical format.

CWDM Technical Overview

- Transmitting up to 16 channels
- Wider spacing between channels – 20nm
- Most CWDM systems support eight channels in the 1470-nm to 1610-nm range

May 01, 2013

Version 1.0

11

- CWDM is an optical technology for transmitting up to 16 channels, each in a separate wavelength or color, over the same fiber strand.
- CWDM technology relies on wider spacing between channels. This design makes cheaper CWDM transceiver a relatively inexpensive technology for transmitting multiple gigabit-per-second signals on a single fiber strand.
- In the point-to-point configuration shown in Figure, two endpoints are directly connected through a fiber link. The ITU has standardized a 20-nm channel-spacing grid for use with CWDM, using the wavelengths between 1310 nm and 1610nm.
- Most CWDM systems support eight channels in the 1470-nm to 1610-nm range.

CWDM Technical Overview

► Industry Standard Color Coding Scheme

1270	light purple		1450	yellow orange	
1290	sky blue		1470	gray	
1310	yellow green		1490	violet	
1330	yellow ocher		1510	blue	
1350	pink		1530	green	
1370	beige		1550	yellow	
1390	white		1570	orange	
1410	silver		1590	red	
1430	black		1610	brown	

For CWDM systems an industry standard color coding scheme is used.

DWDM Technical Overview

- Transmitting from 16 to 64 channels
- For 16 channel DWDM system, spacing between channels is 0.78nm

May 01, 2013

Version 1.0

13

DWDM can transmit up to 160 channels on the same fiber strand by tightly packing them.
